Sheath blight - IRRI Rice Knowledge Bank

< **What It Does** Why and Where It Occurs How to Identify Why Is It Imp >

Sheath blight is a fungal disease caused by *Rhizoctonia solani*. Infected leaves senesce or dry out and die more rapidly, young tillers can also be destroyed. As a result, the leaf area of the canopy can significantly be reduced by the disease. This reduction in leaf area, along with the diseased-induced senescence of leaves and young infected tiller...
